Frogger Game - AI Chat History

01 / Assignment setup and baseline

STUDENT REQUEST

Explain what I should do for the Frogger Lab 4 assignment and what I need to submit.

AI GUIDANCE

Use the Frogger starter repository (SETAPESU26/01_frogger), run the original game, and record a short before video. Make distinct feature changes, commit each task separately to your own GitHub repository, then record an after video and prepare the final submission files. A pull request to the upstream starter repository is not required.

02 / Task 1 - Collision correction

STUDENT REQUEST

How should I correct vehicle collision detection?

AI GUIDANCE

Update the collision logic in game/collisions.py using rectangle-overlap checks so the frog and a vehicle collide only when their areas intersect. Test both actual overlaps and near-misses. Suggested commit: Task 1: Fix vehicle collision detection.

03 / Task 2 - Lives and respawn

STUDENT REQUEST

Give me the full code and tell me where to replace it for the lives task.

AI GUIDANCE

Modify game/game_engine.py to track three lives. On a vehicle collision, subtract one life and return the frog to its starting position. When no lives remain, show Game Over; support restarting with R. Suggested commit: Task 2: Add lives and respawn system.

04 / Resolving a Git directory mistake

STUDENT REQUEST

Terminal says: fatal: pathspec game/game_engine.py did not match any files. What should I do?

AI GUIDANCE

The terminal was in the home directory (~), not the Frogger project root. First change into the local Frogger repository and verify that game/game_engine.py exists; only then run git add, git commit and inspect git log. Avoid accidentally committing unrelated files from the home directory.

05 / Task 3 - Goal and scoring

STUDENT REQUEST

What changes are needed for the next task?

AI GUIDANCE

Introduce score tracking and a win state in the game engine. Detect when the frog reaches the goal, update the score or completion status, display the win state, and reset this state on restart. Suggested commit: Task 3: Add goal and score tracking.

06 / Task 4 - Timer and gameplay test

STUDENT REQUEST

What is left after the score task?

AI GUIDANCE

Add a 30-second countdown and define the result when time expires. Run a final gameplay check covering collision, life loss, respawn, Game Over, restart, scoring, goal completion and timeout. Capture the improved game in an after video.

07 / GitHub upload and submission

STUDENT REQUEST

She told us to make a ZIP and upload to GitHub. What are the deliverables?

AI GUIDANCE

Use a repository showing the separate task commits, include the updated project files, and prepare the before/after gameplay videos and requested chat-history PDF. Package the required materials into the Lab-4 submission ZIP according to the instructor's portal instructions. Push to your own GitHub repository rather than opening a pull request to the starter project.

Selected evidence of AI use: understanding requirements, explaining code modifications, debugging a Git path error, organizing incremental commits, and checking deliverables. Final source files, videos, and repository history should be submitted separately as requested.
